Part I – General Information

In accordance with Section 56-5-1350 of the South Carolina Code of Laws, a tabulation and analysis of collision reports has been completed for the year 2006 as disclosed in this publication.

The number of traffic fatalities decreased from 1,093 in 2005 to 1,044 in 2006, a 4.5% decrease. The mileage death rate (MDR) decreased as well. It fell to 2.1 deaths per hundred million vehicle miles of travel from 2.2 in 2005.

Traffic fatalities are the most severe consequence of motor vehicle collisions, but even in non-fatal collisions, the cost in human suffering can be severe. There were 50,144 reported traffic injuries in 2006, up 0.6% from 2005.

Traffic collisions are responsible for billions of dollars in economic loss to South Carolina each year. Economic loss as estimated in this publication includes property damage, medical costs and lost productivity, but does not include intangible costs such as grief and suffering. In 2006, \$2.82 billion dollars in estimated loss was incurred which is a 3.3% increase from 2005.

What is responsible for the tragedy of motor vehicle collisions and what strategies should concerned individuals employ in the reduction of collisions in the future? On the following pages, statistics are presented which describe the characteristics, causes and effects of traffic collisions in South Carolina. It is hoped that this information will be useful to all persons interested in fostering a safer operating environment for motorists in South Carolina.

All collision statistics included in this publication are based on the Uniform Traffic Collision Report Forms (TR-310) received from investigating officers. By law, any collision that results in at least \$1,000 in total property damage, or results in injury or death and occurs on a public highway must be reported to the South Carolina Department of Public Safety on the appropriate form. If these collisions occur on private property or are reported on any form other than the TR-310, they are excluded.

The statistics contained in the South Carolina Traffic Collision Fact Book are based on the latest available information at the time that they were compiled. Due to the complex nature of the data, occasionally new information is received after the publication cut-off date. It is therefore possible that some discrepancies may exist between the data published here and other sources.

TRAFFIC COLLISION QUICK FACTS

*Mileage Death Rate per 100 million vehicle miles of travel.

**Vehicle Miles of Travel in millions of miles.

*** Due to a new reporting format, more 'possible injuries' were reported than in previous years.

****Reporting threshold changed midyear to \$1,000 from \$400.

MILEAGE DEATH RATE SOUTH CAROLINA vs. NATIONAL AVERAGE 1981-2006

Source for U.S. data: National Highway Traffic Safety Administration. (NHTSA)

South Carolina's mileage death rate, MDR, (defined as the number of traffic fatalities per 100 million vehicle miles of travel) shows an overall declining trend over the past 25 years. Unlike the national trend however, the chart above shows that South Carolina has seen it's MDR increase in 8 of the 26 years represented. The national MDR has been either maintained or shown a decrease from the previous year's MDR for the same 25 year period, except for 2005 when it rose again to 1.5.

In 2003, South Carolina achieved an all time low MDR of 2.0, however it rose to 2.1 in 2004 and to 2.2 in 2005. In 2006, the MDR once again decreased to 2.1 fatalities per 100 million vehicle miles of travel.

PRIMARY CONTRIBUTING FACTOR

The 2006 South Carolina Traffic Collision Fact Book reports on the primary contributing factor in a traffic collision. This information comes directly from the collision report form filled out by the investigating officer. It is important to realize that while the report form has a field for primary contributing factor, it can also report up to four (4) other contributing factors for each collision (see appendix page 131). Thus, we rely on the investigating officer's judgment as to the primary contributing factor for a collision.

Some action (or inaction) by one or more of the drivers was cited as the primary contributing factor in 106,079 of the 112,949 reported traffic collisions in 2006. This accounted for 93.9% of all primary contributing factors, a percentage equal to the previous year of 93.9%. In fact, the top nine primary contributing factors were driver related. Environmental factors accounted for the next largest category of collision causes with 3,215 or 2.8% of the total. The vast majority of these (2,673) involved an "Animal in the Roadway," and accounted for 2.4% of all collisions. The "Non-Motorist", "Road" and "Vehicle" categories together accounted for only 3.2% of all reported traffic collisions in 2006.

For fatal collisions in 2006, some type of driver error was considered the primary contributing factor in 850 of the 973 collisions, accounting for 87.4% of all collisions in which someone was killed. This percentage is lower than that of all collisions, which is 93.9%. The specific causes of fatal collisions were quite different from all collisions. The leading primary contributing factor of fatal collisions was "Driving Too Fast for Conditions" with 221 collisions (22.7%), and "Driving Under the Influence" was a close second with 148 collisions (15.2%). The next leading factors were "Failed to Yield Right of Way", "Ran Off the Road", and "Exceeded Speed Limit" with 115, 66, and 56 fatal collisions, respectively. The proportion of "Non-Motorist" (mostly "Pedestrian in Roadway") causes was much higher in fatal (9.9%) as compared to property damage only collisions (0.28%).

FIRST HARMFUL EVENT

The first harmful event (FHE) in a traffic collision is defined by the National Safety Council as the first occurrence of injury or damage in a collision. In 2006, the FHE in 88,917 of the 112,949 reported traffic collisions (78.7%) involved some type of collision between a motor vehicle in transport and an object not fixed. The top two FHE's, both involving a collision with an object not fixed, were "Collision with Motor Vehicle in Transport," 75,159 (66.5%) and "Collision with Stopped Vehicle," 9,450 (8.4%). The third FHE was "Tree" in the "Collision with Fixed Object" group, with 4,757 collisions (4.2%). Combined, these three accounted for more than 79% of all reported collisions.

"Collisions with an Object Not Fixed" accounted for a substantially smaller percentage of the fatal collisions (50.4%) than the property damage only collisions (81.1%). Collisions involving a "Collision with a Fixed Object" accounted for a substantially greater percentage of the fatal collisions (37.3%) than for property damage only (16.1%). The leading FHE in fatal collisions was "Collision with Motor Vehicle in Transport" with 365 (37.5%); the second leading FHE in fatal collisions was "Collision with Tree" with 174 (17.9%).

Part II - Collision Characteristics

There are many characteristics associated with traffic collisions. Patterns in these characteristics can provide insight into the cause of collisions and may ultimately lead to effective countermeasures for reducing the number of collisions that occur and minimizing the severity of those that will still occur. The data provided on the following pages may raise interesting questions for those interested in highway safety. These questions may in turn lead to research, which addresses a particular collision characteristic. Here are some examples of traffic collision characteristics for 2006:

A. Driver

- ◆ Male drivers between the ages of 20 and 24 continue to be over represented in fatal collisions. In 2006, male drivers in this age group represented 4.1% of all licensed drivers and 9.7% of drivers involved in fatal collisions.
- ◆ Two thirds of all drivers involved in traffic collisions were not charged with any violation.
- ◆ The leading traffic violation in 2006 was "Speeding less than 10 miles over the limit".

B. Time

- ◆ More than 60% of fatal collisions occurred between the hours of 3:01 p.m. and 3:00 a.m.
- ◆ The months of April, May and September had the most fatal collisions, 98, 104, and 104, respectively.
- ◆ More traffic deaths occurred on the three weekend days (Friday, Saturday, Sunday) than on the four week days (Monday, Tuesday, Wednesday, Thursday).

C. Location

- ◆ More fatal collisions and deaths occurred on state secondary routes than on any other route category.
- ◆ More than 1 out of every 3 fatal crashes occurred on secondary routes.
- ◆ There were 15 persons killed in work zone collisions in 2006.

D. Environment

- ◆ Almost 87% of all traffic collisions occurred during clear or cloudy weather conditions.
- ◆ More than 83% of all collisions occurred on a dry road surface.

E. Vehicles

- ◆ Automobiles made up about 55% of all units involved in traffic collisions during 2006.
- ◆ Automobiles, pickup trucks, and SUV's made up 70% of the vehicles involved in fatal crashes.

A. The Driver

Numerous decisions are required of drivers while operating a motor vehicle. All too often, poor judgement, inattention or carelessness on the part of a driver results in a dangerous driving decision, which leads to a traffic collision. The primary contributing factor in almost 94% of all reported traffic crashes was driver-related in 2006. Often, the officer investigating the collision will issue a citation to one or more of the drivers involved. Driver violations charged to drivers involved in traffic collisions reported during 2006 are as follows:

<u>Violation</u>	<u>Amount</u>	<u>%</u>
1. Speeding < 10 MPH Over Speed Limit	22,895	29.4
2. Failure to Yield Right of Way	13,704	17.6
3. Driver's License Violation	4,873	6.3
4. Driving Under the Influence	4,419	5.7
5. Following Too Close	3,471	4.5
6. Disregarded Sign or Signal	3,051	3.9
7. Changing Lanes Unlawfully	2,869	3.7
8. Driving Under Suspension	1,845	2.4
9. Improper Turning	1,407	1.8
10. Uninsured	1,362	1.8
11. <u>Other Violations</u>	<u>17,295</u>	<u>7.3</u>
Total	77,821	100

Enumerated on the following pages are the numbers of licensed drivers by age and gender and the number of drivers involved in collisions by age and gender. Based on the figures indicated in these tables, nearly 1 out of every 8 (13%) of all licensed male drivers between the ages of 15 and 24 years of age was involved in a traffic collision in 2006. About 1 in 10 (10%) of the female drivers in the same age group were involved in collisions. For the entire licensed population, approximately one out of every 18 drivers was involved in a collision during the year. **More than 71% of the drivers in fatal crashes were male.**

**These figures only represent drivers of units defined as a motor vehicle.

OUT OF STATE DRIVERS INVOLVED IN TRAFFIC COLLISIONS***SOUTH CAROLINA DRIVERS TOTALED - 168,672**

* Figures only represent drivers of any motor vehicle requiring a valid driver's license. There were 16,422 drivers that did not present a valid driver's license at the time of the crash.

DRIVERS INVOLVED IN FATAL COLLISIONS BY ROUTE CATEGORY AND LICENSE STATE

B. Time

The frequency of traffic collisions is affected by the settings of the clock and calendar. The concentration of traffic, for example, is heavier at certain times of the day, days of the week and month. Travel is also affected by holidays and by special events such as football games. In addition to travel, driver attitudes, vision and behavior are influenced by time factors, weather, and time of year. On the following pages, statistics are presented which indicate observable time variables. Some of the important observations in the 2006 data are as follows.

- ◆ More traffic deaths occurred on the three weekend days (Friday, Saturday, Sunday - 555), than on the four weekdays (Monday, Tuesday, Wednesday, Thursday - 489).
- ◆ Property Damage Only collisions are much more likely to occur during daylight hours. More than 71% of the collisions that have no injuries or fatalities occurred between 6:01 am and 6:00 pm.
- ◆ In contrast to the Property Damage Only collisions, fatal collisions occurred more frequently in the nighttime hours between 6:01 pm and 6:00 am. Approximately 57% of all fatal collisions occurred during this twelve-hour period.
- ◆ More traffic crashes were reported on Friday than any other day of the week with 20,484 collisions during 2006, accounting for more than 18.1% of the total. No other day of the week experienced as many as 17,000 collisions. The fewest traffic collisions were reported on Sundays with 11,412 or 10.1%.
- ◆ As in past years, more fatal collisions were reported on Saturday (198) than any other day. This accounted for about 20.3% of all fatal collisions and resulted in the deaths of 211 persons. The fewest number of fatal collisions occurred on Monday with 109, resulting in 118 fatalities. This represents the fourth year in a row that all seven days of the week experienced at least 100 fatal collisions.
- ◆ October was the leading month for all collisions in 2006, with 10,697. The leading month for fatal collisions was tied between May and September with 104 collisions each. May also had the most fatalities with 113. January had the fewest fatal collisions with 54. January also had the fewest fatalities with 58.

C. Location

No area of South Carolina was immune from traffic collisions in 2006. Every county experienced the tragedy of at least one fatal traffic collision during the year. Ten of the state's 46 counties had at least 40 traffic fatalities during 2006. A variety of factors influence where traffic collisions, injuries and fatalities occur including the volume of traffic on a particular highway, weather variations and travel patterns. Statistics are presented on the following pages, which indicate observable differences in the occurrence of traffic collisions with relation to various location categories. Some important observations in the data are as follows.

- ◆ In 2006, Charleston County had the most total traffic collisions (13,334), injury collisions (3,503) and non-fatal injuries (5,297). Greenville County had the most fatal collisions (78) and Charleston had the most property damage only collisions (9,773). Greenville County also had the most fatalities (80).
- ◆ A total of 61,088 collisions were investigated by the South Carolina Highway Patrol. This represents 54.1% of all traffic collisions in South Carolina for 2006. The Highway Patrol investigated an even greater proportion of the fatal crashes – 82.4%.
- ◆ In 2006, Secondary and US Primary routes had the most traffic collisions. Respectively, they had 31.7% and 28.7% of the reported total. SC Primary routes were next, accounting for 27.9% of the total collisions.
- ◆ The Secondary routes accounted for the largest percentage (37.8%) of fatal collisions. The 368 fatal collisions that occurred on Secondary routes represent over three times the number of fatal collisions (112) reported on South Carolina's Interstates.
- ◆ A total of 11,630 collisions occurred on the interstates. This was about 10.3% of the total reported traffic collisions for the year.

ROUTE CATEGORY IN NON-FATAL VS. FATAL COLLISIONS

There were 35,788 traffic collisions reported on Secondary routes during 2006. This was the most for the five route category classifications and accounted for 31.7% of all reported collisions. US Primary routes were a close second, accounting for 31,508 of the reported collision total. The fewest reported collisions were on County routes; a total of 9,466 were reported for these routes.

Secondary routes had the most fatal collisions by a wide margin. The 368 fatal collisions occurring on the Secondary route system accounted for 37.8% of the 973 fatal collisions reported in 2006. On the US Primary and SC Primary routes there were 217 and 228 (respectively) fatal collisions reported for the year. The fewest number of fatal collisions occurred on the County routes with 48 (4.9%). A total of 112 (11.5%) fatal collisions were reported for the Interstate routes.

D. Environment

The environment in which motorists operate their vehicles can contribute to the occurrence of traffic crashes. Environment is defined herein as the combination of external or extrinsic physical conditions that affect and influence the operation of a motor vehicle. These include road surface, weather, light conditions, traffic control, road character, trafficway, junction type, and work zone type for each driver.

One or more of the environmental factors can be the primary factor of a collision or may be a contributing factor in a given crash. Weather, light, and surface conditions are substantially beyond the control of engineering or law enforcement efforts. Changes in traffic controls, road character, trafficway, junction type, and work zone type factors can all be effected by traffic engineering efforts.

As reflected in the statistics on the next two pages, most collisions occur under favorable environmental conditions: dry roadway (83.4%); clear weather (78.4%); daylight (71.0%); no traffic control device (61.0%); and straight-level road (77.3%).

For fatal collisions, the percentages of collisions which occurred under the most favorable surface and weather conditions were about the same or even higher for most environmental factors. The largest difference is seen in light conditions, where 57.6% of fatal collisions did not occur during daylight hours. The percentage of fatal collisions occurring under the most favorable environmental conditions are as follows: dry roadway (87.7%); clear weather (81.1%); daylight (42.4%); no traffic control (74.0%); and straight-level roadway (59.9%).

Environmental factors were the primary contributing factor in only 3.2% of all collisions in 2006. The environment may have been a contributing factor to collisions where it was not the primary contributing factor. Efforts to improve those environmental factors which can be controlled (especially traffic control and road character) should help to reduce the frequency of traffic crashes in South Carolina.

E. Units

The consequences of traffic collisions are affected by the types of 'units' that are involved. A collision between a relatively large unit, such as a truck or train, and a smaller unit, such as a motorcycle, transmits a substantially greater force to the smaller vehicle, and hence to its occupants or riders, than a collision between two vehicles of comparable size. This irrefutable law of physics probably accounts for the over representation of certain 'unit types' in traffic collisions. Some of the key findings in the 2006 data are as follows:

- ◆ The most common unit involved in traffic crashes in 2006 was the automobile. Out of 210,890 units involved in traffic collisions during the year, 116,391 were automobiles. This represents 55.2% of the total units.
- ◆ For fatal collisions, a much smaller percentage of units involved were automobiles. Of the 1,585 units involved in fatal collisions, 645 or 40.7% were automobiles.
- ◆ There were 125 pedestrians killed in 2006. This represents 12.5% of all pedestrians involved in traffic crashes during the year.
- ◆ There were 7 fatal crashes involving railway trains resulting in 10 fatalities.
- ◆ There were 106 fatal crashes involving motorcycles resulting in 108 fatalities. Of those 108 fatalities, 104 were motorcyclists.
- ◆ A total of 66 fatal crashes involving truck tractors resulted in 79 deaths in 2006.
- ◆ A total of 583 drivers were killed in 2006. This represents 75% of the motor vehicle occupants killed.

A motor vehicle traffic collision is defined by the National Safety Council (NSC) as one in which: (1) the unstable situation originates on a trafficway or (2) a harmful event occurs on a trafficway. Using the NSC definition, each of the unit types listed above was involved in a collision which involved at least one motor vehicle. Units considered as motor vehicles are denoted with (**). Units denoted by three asterisks, (***) may or may not be a motor vehicle, depending on the means by which they were propelled. For units not considered motor vehicles, the collision included at least one other unit which was a motor vehicle.

TOTAL UNITS	1,585	60,103	149,202	210,890

By far the most frequent action prior to impact for units involved in all traffic collisions in 2006 was 'Movement Essentially Straight Ahead' with 55% of the total units. For fatal collisions 'Movement Essentially Straight Ahead' made up 70% of all fatal collisions. The second most occurring action prior to impact for all collision types was 'Slowing or Stopped in Traffic' accounting for 20% of the units. For fatal crashes the second most seen action prior to impact was 'Turning Left' accounting for 5% of the units.

Out of 104 motorcycle riders killed in 2006, 93 were male, 35 were under age 35 and 73 were not wearing a helmet. Out of the 2,250 riders of motorcycles who were involved in traffic collisions, 576 were wearing a helmet, 1,401 were not, and for 273 riders, helmet usage was unknown. For those cyclists under 21 years of age, helmet usage is required by law. For this group, 3 fatalities were wearing a helmet, and 2 fatalities were not.

*Includes occupants seated in pickup beds, covered and uncovered, plus occupants seated in any other area on the outside of the pickup.

Part III - Collision Consequences

The consequences of traffic collisions extend beyond those persons directly affected and are measured in both human and economic terms. The economic costs consider that portion of financial loss borne by society (i.e. medical costs), property damage, lost productivity, etc. Opposite the economic losses are the intangible human costs associated with the grief and suffering that accompany a traffic death or injury. On the following pages, statistics related to estimated economic cost, traffic injuries, fatalities and restraint usage are presented. Some important observations in the 2006 data are as follows:

- ◆ Economic loss increased by 2.2% in 2006.
- ◆ Males accounted for 74% of the traffic fatalities in 2006, up from 72% in 2005. In 1972, males accounted for 75.3% of all traffic fatalities.
- ◆ There were 274 females who died in traffic collisions in 2006 and 770 males.
- ◆ A total of 276 persons under the age of 25 were killed in traffic collisions, accounting for more than 26% of the total persons killed.
- ◆ There were 938 automobile and truck occupants totally ejected from the vehicles in which they were riding. Of these, 173, or 18.4%, were killed. Of the 265,208 occupants not ejected, 545, or 0.2%, were killed. The percentage of fatalities suffered by ejected occupants was nearly 100 times that of occupants not ejected.
- ◆ In 2006, there were 10,090 children under the age of six who were occupants of a car or truck that was involved in a traffic collision. Of these, 7,343 were restrained by a child safety seat, 2,268 by some other restraint (seat belt, seat/lap combination), 268 were unrestrained and for 193 restraint usage was unknown.
- ◆ Of the 736 occupant fatalities with known restraint usage, 472 (64.1%) were not restrained, and 264 (35.9%) were restrained.
- ◆ More than 16% of those occupants not wearing a seat belt at the time of collision were severely injured or killed. This compares to less than 1.0% for those wearing a seat belt.

TRAFFIC FATALITIES BY SEATING LOCATION
MOTOR VEHICLE OCCUPANTS ONLY

Part IV – Alcohol & Drugs

Alcohol and/or drug related traffic collisions are responsible for a large portion of reported traffic collisions each year. The percentage of collisions that involve alcohol or drugs increases as the severity of injuries increases. On the following pages collision statistics are presented which are based on contributing factors in the collision, as determined by the investigating officers. **Collisions listed in this section ARE NOT comparable to any statistics published prior to 2002.**

The data presented here are a summary of all crashes with any contributing factor of under the influence on the TR-310. Every crash includes a primary contributing factor and can also have up to four other contributing factors.

In South Carolina, it is inferred that you are under the influence when your Blood Alcohol Concentration (BAC) reaches a level of 0.08 (as of July 2003). At this level, you are seven times more likely to have a traffic collision than if your BAC is zero. If your BAC reaches 0.15 percent, your chances of having a traffic collision are 25 times greater. Some of the common effects of alcohol at various BAC levels are as follows:

Blood Alcohol Concentration	Changes in Feelings and Personality	Physical and Mental Impairments
0.01 – 0.06	Relaxation Sense of Well-being Loss of Inhibition Lowered Alertness Joyous	Thought Judgment Coordination Concentration
0.06 – 0.10	Blunted Feelings Disinhibition Extroversion Impaired Sexual Pleasure	Reflexes Impaired Reasoning Depth Perception Distance Acuity Peripheral Vision Glare Recovery
0.11 – 0.20	Over-Expression Emotional Swings Angry or Sad Boisterous	Reaction Time Gross Motor Control Staggering Slurred Speech
0.21 – 0.29	Stupor Lose Understanding Impaired Sensations	Severe Motor Impairment Loss of Consciousness Memory Blackout
0.30 – 0.39	Severe Depression Unconsciousness Death Possible	Bladder Function Breathing Heart Rate
= > 0.40	Unconsciousness Death	Breathing Heart Rate

2006 F.A.R.S. (Fatality Analysis Reporting System) *

The National Highway Traffic Safety Administration (NHTSA), through its FARS program, captures the highest blood alcohol concentration (BAC) level among all drivers and pedestrians involved in each fatal traffic collision in the United States. For crashes with no test results available estimates are computed.

In 2006, 560 or 54% of persons were killed in crashes where there was no alcohol involved; there were 57 persons killed where the highest BAC of a driver was between 0.01 and 0.07; and for 420 or 40% of victims, at least one driver involved had a BAC of 0.08 or greater.

*2006 figures are the latest available figures from NHTSA.

**Each collision may have up to five contributing factors listed on the TR-310 report form.

ROUTE CATEGORY IN NON FATAL VS. FATAL ALCOHOL RELATED COLLISIONS

There were 2,107 alcohol related traffic collisions reported on Secondary routes during 2006. This was the most for the five route category classifications and accounted for 42.4% of all reported collisions. SC Primary routes were second, accounting for 1,015 of the reported alcohol related collision total. The fewest reported collisions were on Interstate routes; a total of 375 were reported for these routes.

Secondary routes had the most alcohol related fatal collisions by a wide margin. The 164 alcohol related fatal collisions occurring on the Secondary route system accounted for 40.9% of the 401 alcohol related fatal collisions reported in 2006. On the US Primary and SC Primary routes there were 87 fatal collisions each reported for the year. The fewest number of fatal collisions occurred on the County routes with 23 (5.7%). A total of 40 (10.0%) fatal collisions were reported for the Interstate routes.

Part V - Counties

South Carolina is comprised of 46 counties, each with its own unique set of demographic, geographic, and political characteristics. These and other factors influence events within a county's borders. Using this information, planners can tailor specific countermeasures to the unique situation of a given county. Crime, economic activity, accidents and the subject of this book (traffic collisions) are all affected by these characteristics. On the following pages, a summary of each county's traffic collision characteristics is provided. Among other facts, this data shows the following for 2006:

- ♦ Charleston County had the most traffic collisions with 13,334. This total was just slightly more than the number two and three counties, Greenville (12,193) and Richland (10,951).
- ♦ Greenville County had the most fatal collisions with 78 reported during the year, followed by Horry with 63. Greenville had the most traffic fatalities, with 80. Horry was second, with 66 traffic fatalities.
- ♦ Charleston County had the most injury collisions and persons injured, with 3,503 and 5,267, respectively, in 2006. Greenville County was next with 2,771 injury crashes and 3,988 injuries.
- ♦ The high number of collisions in Horry, Charleston and Richland Counties is largely a result of the large populations and larger amounts of travel within each of these counties.
- ♦ The counties with the highest collision and fatality rates were the rural counties. Jasper County, for example, had 21 fatal collisions in 2006. It ranked sixteenth among the 46 counties in the number of fatal collisions. However, with its population death rate at 105.5 deaths per 100,000 persons continues to make it by far the leading county in the state. Calhoun County was second with a death rate of 79.9 per 100,000 population.

****MOTOR VEHICLE DEATHS PER 100,000 POPULATION

*****INCLUDES OCCUPANTS SEATED INSIDE THE PASSENGER COMPARTMENT OF AUTOMOBILES AND TRUCKS ONLY

130

131

DEFINITIONS

Blood Alcohol Concentration (BAC) - The percentage of a blood sample that is alcohol; e.g., a BAC of .10 is a sample of blood with 1 part alcohol for every 999 parts blood.

Bus - A motor vehicle designed to transport sixteen (16) or more persons, including the driver.

Collision - Throughout this publication the terms collision and traffic collision are equivalent to the term motor vehicle traffic collision as defined below.

Driver - An occupant who is in actual physical control of a transport vehicle, or for an out-of-control vehicle, an occupant who was in control until control was lost.

Driver Intention - What the driver intended to do just prior to the first harmful event and before executing an evasive maneuver.

Economic Loss - All figures are rounded to the nearest \$100,000. Based on the 2006 National Safety Council Formula which applies with the following factors:

Each fatality	\$1,210,000
Each incapacitating injury.....	\$62,500
Each non-incapacitating injury.....	\$20,300
Each possible injury.....	\$11,500
Each *PDO collision.....	\$8,200

Fatal Traffic Collision - Any traffic collision that results in the death of at least one occupant or pedestrian as a direct result of injuries sustained in the collision within 30 days of the collision date.

First Harmful Event - The first event in a traffic collision to result in injury or property damage.

Harmful Event Location - The place, on or off the roadway, where the first injury or property damage occurred. This describes the location of the first harmful event as it relates to its position within or outside the trafficway.

Incapacitating Injury - Any injury, other than a fatal injury, which prevents the injured person from walking, driving or normally continuing the activities he was capable of performing before the injury occurred.

Junction - Either an intersection or the connection between a driveway access and a roadway other than a driveway access.

Manner of Collision - The identification in a crash of how the motor vehicle(s) initially came together in a traffic collision.

Moped - A moped is a speed-limited, motor-driven cycle, which may be propelled by pedaling. Mopeds are not considered motor vehicles.**

Motor Vehicle - Any motorized (mechanically or electrically powered) road vehicle not operated on rails, excluding mopeds, minibikes and other vehicles not subject to motor vehicle licensing regulations. These include: automobiles, trucks, buses, vans and motorcycles.

Most Harmful Event - The event for an *individual unit* involved in a traffic collision that results in the most severe injury or property damage.

Motor Vehicle Traffic Collision - A transport collision that involves at least one (1) motor vehicle in transport, in which the unstabilized situation originates on a trafficway or at least one harmful event occurs on a trafficway. This definition excludes any collision on a private way.

Non-Incapacitating Injury - Any injury, other than a fatal injury or incapacitating injury, which is evident to observers at the scene of the collision in which the injury occurred.

*Property Damage Only

DEFINITIONS

Nonjunction - Anything that is not an intersection or the connection between a driveway access and a roadway other than a driveway access.

Occupant - Any person who is part of a transport vehicle (automobile, bicycle, etc.)

Passenger - Any occupant of a vehicle other than its driver.

PDO - An abbreviation for property damage only. A PDO collision is one with some property damage but no injuries or fatalities.

Pedalcycle - A non-motorized vehicle propelled by pedaling (bicycle, tricycle, etc.). Note: The pedalcycle pages include all types but mostly bicycles.

Pedestrian - Any person who is not an occupant as defined above. Includes persons on foot, roller skates, and skateboards.

Possible Injury - Any injury that is reported or claimed which is not a fatal injury, incapacitating injury or non-incapacitating injury.

Private Way (Private Property) - Any land other than a trafficway. This includes parking lots even if they are designed for public use. Collisions on private ways are not included in this publication.

Probable Cause - Refers to the probable cause of the traffic collision. This is the presumptive factor that created the collision situation.

Road - The part of a trafficway which includes both the roadway and any shoulder alongside the roadway.

Rural Area - Any area which is not within a defined urban area.

Traffic Collision - Used in this publication interchangeably with Motor Vehicle Traffic Collision.

Traffic Unit (Unit) - Any motorized road vehicle (includes vehicles that do and do not qualify as motor vehicles in the above definition), pedestrians, animal drawn vehicle and animals with human riders.

Trafficway - Any land way open to the public as a matter of right or custom for moving persons or property from one place to another.

Truck Tractor - A motorized vehicle consisting of a single motorized transport device designed primarily for drawing.

Unit - Used interchangeably with traffic unit (see definition above).

Urban Area - An area composed of an incorporated place of at least 5,000 population along with the surrounding densely settled areas.

Source for most definitions: *Manual on Classifications of Motor Vehicle Traffic Collisions, Fifth Edition*, published by the National Safety Council.

****** A moped is defined in the South Carolina Code of Laws, Section 56-1-1710 (1990). In part, this specifies that the "... motor is not to exceed fifty cubic centimeters and produce not more than one and one-half brake horsepower which is not capable of propelling the vehicle at a speed in excess of twenty-five miles per hour on level ground.

Work Zone Type, All and Fatal Collisions	40

ACKNOWLEDGEMENTS

The Office of Highway Safety of the South Carolina Department of Public Safety would like to take the opportunity to express our sincere appreciation to all persons, agencies, departments and organizations who have contributed to this publication.

The vast majority of data used to produce this publication was tabulated from the Uniform Traffic Collision Report for Investigating Officers. These reports were submitted by members of the South Carolina Highway Patrol, City Police Departments and various other Law Enforcement Agencies.

The Office of Highway Safety gives special recognition to the above traffic investigative agencies and, in doing so, cannot forget the support and cooperation of other agencies and organizations.

The Office of Highway Safety, which tabulated the traffic collision data and other pertinent information for this publication, could not have done so without the untiring efforts of the above persons and organizations.
